

# Tutorial 1: *Programming with JavaScript*

## Debugging JavaScript using Mozilla Firefox

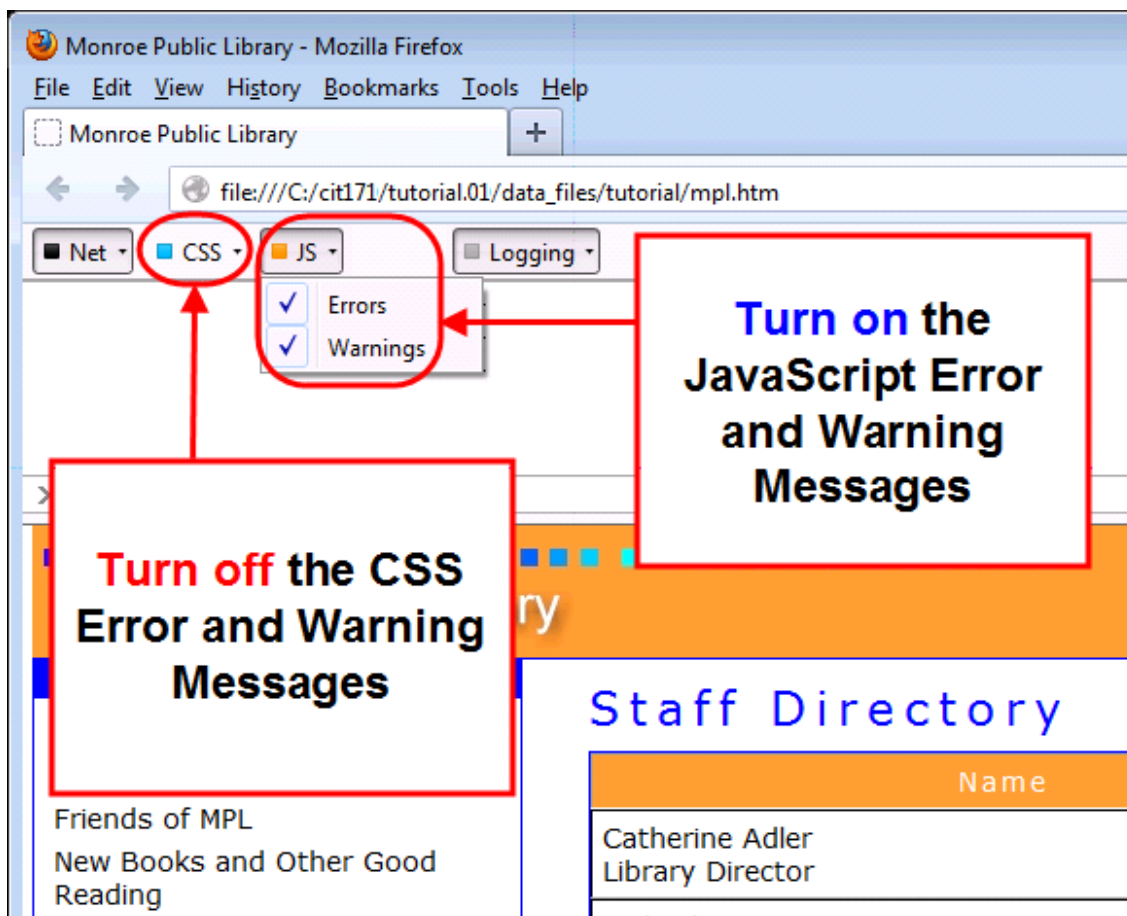

If your *Tutorial 1* Web page named [mpl.htm](#) is not displaying correctly, follow these steps to find the JavaScript coding error if using Mozilla Firefox Web browser.

To find your JavaScript error, turn on the **Web Console** in the Mozilla Firefox Web browser.

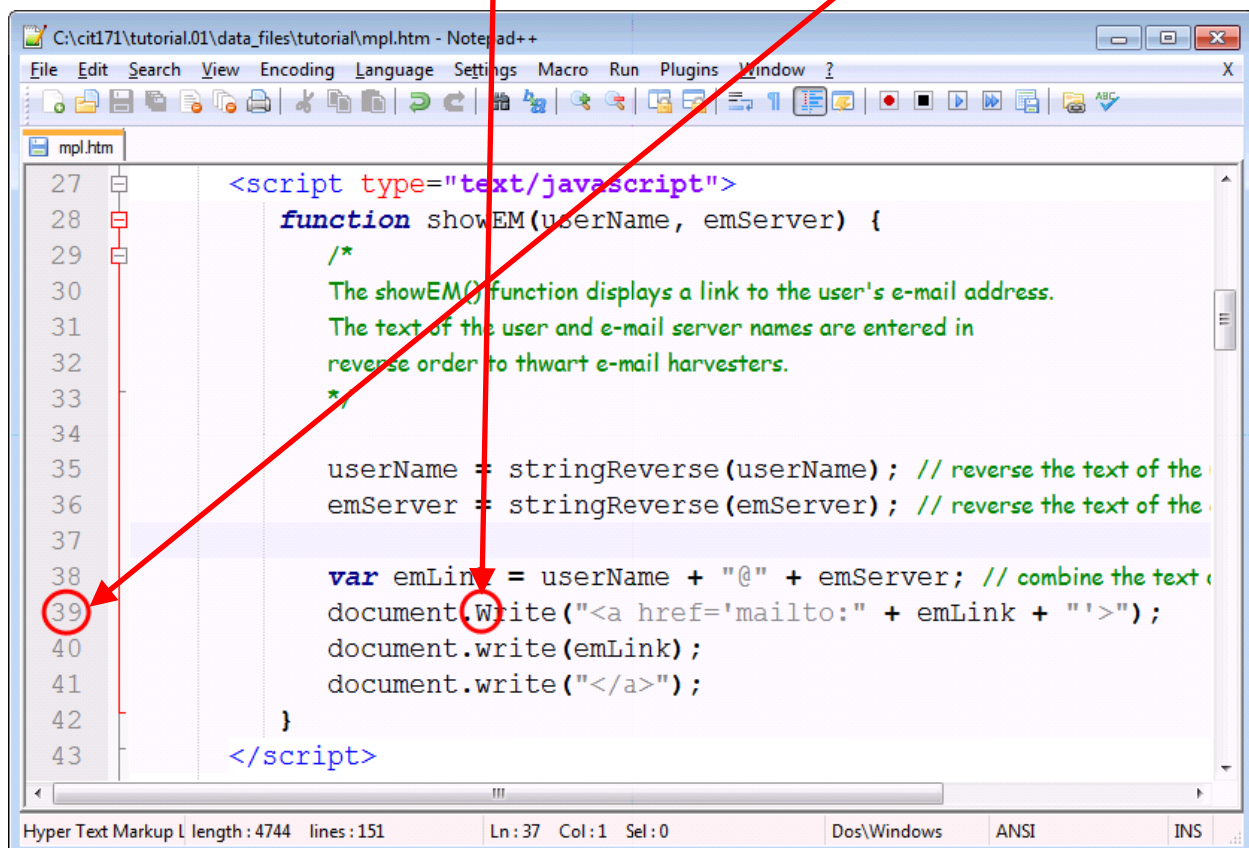

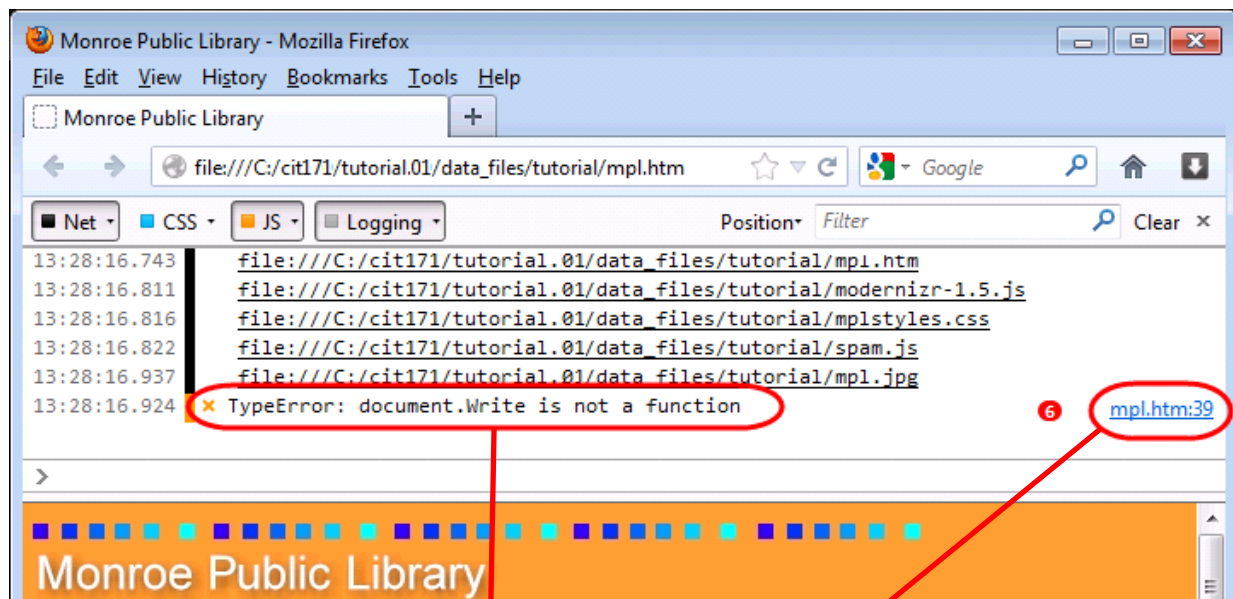

Set the **error and warning message level** in the **Web Console**. To focus in on only the JavaScript errors you can turn off the CSS error and warning messages.

Track down your JavaScript errors using the information contained in the [Web Console](#) of the Mozilla Firefox Web browser.

The error in this case has to do with the fact that [JavaScript language is case sensitive](#). The method named [write](#) of the document object was typed incorrectly. A lower case letter “w” should have been used instead of the upper case letter “W”.

This is what the *Tutorial 1* Web page named [mpl.htm](#) should look like when all the JavaScript errors have been fixed.
