

Tutorial 3 Additional Project

In this project, you will create code to create a table of pictures in a page from arrays.

1. Open **puppies.htm** in a simple text editor.
2. Open the **puppies.js** file in a simple text editor. It has arrays already defined for your use in it.
3. Insert comments in both files that designate you as the author of the files.
4. In the div mainContent of **puppies.htm**, after the first paragraph code, add a **<script>** element.
5. First generate the opening table tags followed by a header row with cells for **Picture**, **My Comments**, and **Date Taken**.
6. Loop through the **puppyPics**, **pictureDesc**, and **pictureDate** arrays while creating table rows that display in each row, a puppy picture, picture description, and then picture date.
7. Generate a caption saying how many photos there are now using appropriate array info to get the number.
8. Generate the closing table tags.
9. Test your finished code in a browser. Make corrections as necessary.
10. Print a copy of **puppies.htm**.
