Tutorial 9: *Storing Data with Cookies*
Textbook Corrections

1. **Page JVS 527**

   The first sentence should read "Recall that using the new Date() method without a specific date returns the current data and time.

2. **Page JVS 560**

   The parentheses that follow `cookiesArray` in the second line of code should be eliminated so that the following line of code is used –

   ```
   var cookiesArray = document.cookie.split(";");
   ```

   NOTE: The web page demo_cookies.htm file contains the following statement that will not function in a Firefox browser:

   ```
   if (cookieList.insertAdjacentHTML) {
      cookieList.insertAdjacentHTML("BeforeEnd", cookieTable.outerHTML);
   }
   else {
      cookieList.appendChild(cookieTable);
   }
   ```

   Perhaps you should only load this page in Microsoft IE. If you do decide to load this page in Firefox, it will display the cookie, but you won't be able to delete it with this page.

   NOTE: Consider adding the following statement at the beginning of the `saveMemberInfo()` function that's defined in the register.js file –

   ```
   deleteCookie("memberInfo");
   ```

   This will enable you to entirely replace all of the data that has previously been saved in the `memberInfo` cookie.
